Submitted (JUL-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CA(2+)-DEPENDENT RECEPTOR FOR MYELOID CELLS THAT BINDS
TO CARBOHYDRATES ON NEUTROPHILS AND MONCYTES. MEDIATES THE
LEUKOCYTES. THE LIGAND RECONNIZED IS STALYL-LEWIS X.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: BELONGS TO THE SELECTIN/LECAM FAMILY.
-!- SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.
-!- SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL; L34270; AAB59261.1; ... PUNCTION: NHASE CATALYZES THE HYDRATION OF VARIOUS NITRILE COMPOUNDS TO THE CORRESPONDING AMIDES. INDUSTRIAL PRODUCTION OF ACRYLAMIDE IS NOW BEING DEVELOPED USING SOME OF THESE ENZYMES.

ACRYLAMIDE IS NOW BEING DEVELOPED USING SOME OF THESE ENZYMES.

CATALYTIC ACTIVITY: An aliphatic amide = a nitrile + H(2)O.

SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN.

INDUCTION: BY COBALT AND UREA OR CYCLOHEXANECARBOXAMIDE.

SYMILARITY: BELONGS TO THE NITRILE HYDRATASE SUBUNIT BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                  The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biodieaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan plaque bacteria. GO is useful as a research tool for identification, characterisation and material as a research tool for identification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 characterisation and purification of interacting regulatory proteins
                                                                                                                                                                                                                                                         Example 1; Page 10; 65pp; English.
                                                                                                                                                                                                                                                                                                 Novel variant galactose oxidase enzyme for oxidizing a compound such as guar which is useful in paper making, for enzymatic synthesis of aldehydes and pulp biobleaching, has at least one substituted amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE12925;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAE12925 standard; Protein; 639 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a peptide linker used in the fusion proteins of the invention. The specification describes a method for improving pathogen resistance or tolerance of a plant. The method fusion protein which comprises two or more protein or domains that are capable of improving pathogen resistance or tolerance when inhibitors are co-delivered, as a fusion, to Arabidopsis thatianis are connected by a peptide linker. The method is used to improve pathogen resistance or tolerance of a plant and its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

      The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan plaque bacteria. GO is useful as a research tool for identification, characteristics and main colorectal as a research tool for identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE12926

30-AUG-2001.

Dactylium dendroides. mutant; mutein.

```
The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising their cDNA molecules. Go f many complex compounds such as guar, major D-galactose side chains of many complex compounds such as guar processes, glycolipid of human red cells. GO is useful in paper making processes, pulp generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp generation of the use of GO-Schiff's reagent for early detection and biobleaching, the use of GO-Schiff's reagent for early detection
                                                                                                                                                   Novel variant galactose oxidase enzyme for oxidizing a compound such as guar which is useful in paper making, for enzymatic synthesis of guar which is useful in paper making, the substituted amino alidenydes and pulp biobleaching, has at least one substituted amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0

```
The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major
                                                                                                  Novel variant galactose oxidase enzyme for oxidizing a compound such as aldehydes and pulp biobleaching, has at least one substituted amino
                                                                                   Claim 7; Page -; 65pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ρ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The present sequence is not shown in the specification but is derived from Dactylium dendroides galactose oxidase SEQ ID NO: 2 shown in page 10 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             aldehydes and pulp biobleaching, has at least one substituted amino
                                                                                                                                                                                                                                                                                                                                  Dactylium dendroides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
         Novel variant galactose oxidase enzyme for oxidizing a compound such guar which is useful in paper making, for enzymatic synthesis of aldehydes and pulp biobleaching, has at least one substituted amino

Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
        Novel variant galactose oxidase enzyme for oxidizing a compound such guar which is useful in paper making, for enzymatic synthesis of aldehydes and pulp biobleaching, has at least one substituted amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page -; 65pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The present sequence is not shown in the specification but derived from Dactylium dendroides galactose oxidase SEQ ID NO: 2 shown in page 10 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to variant galactose oxidase (vGO) proteins and their cDNA molecules. Galactose oxidases are useful for oxidising
                                                                                                                                                                                                                                                                            /note= "Wild type Cys substituted with Ser" Misc-difference 436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Galactose oxidase; pulp biobleaching;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)

GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)

Galactose oxidases are useful for oxidising D-galactose side chains of many complex compounds such as guar, major glycolipid of human red cells. GO is useful in paper making processes, generation of H2O2 in situ, enzymatic synthesis of aldehydes, pulp biobleaching, the use of GO-Schiff's reagent for early detection and prognosis in human colorectal adenocarcinoma and use of GO-glucan binding domain fusion proteins as targetting inhibitors of dental plaque bacteria. GO is useful as a research tool for identification, characterisation and purification of interacting regulatory proteins. The present sequence is Dactylium dendroides galactose oxidase (GO)
                                                                                                                                                                                                                                                                                                                              Note: The present sequence is not shown in the specification but is derived from Dactylium dendroides galactose oxidase SEQ ID NO: 2 shown in page 10 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel variant galactose oxidase enzyme for oxidizing a compound such as guar which is useful in paper making, for enzymatic synthesis of aldehydes and pulp biobleaching, has at least one substituted amino acid -

TRANSPOSASE APPARENTLY BINDS 3 SPECIFIC BLOCKS OF SEQUENCES AT EACH END OF MU DNA. MISCELLANEOUS: THE A GENE IS REGULATED BY THE REPRESSOR C, WHICH BINDS TO AN OPERATOR SEQUENCE & TURNS OFF TRANSCRIPTION. REPRESSOR C CAN, AT HIGH CONCENTRATIONS, OCCUPY ALMOST THE EXACT SAME SITES ON MU ENDS AS THE TRANSPOSASE, AND TRANSPOSASE CAN BIND TO FRAGMENTS CONTAINING THE MU OPERATOR SEQUENCE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DURING THE FORMATION OF THE 70S RIBOSOMAL COMPLEX (BY SIMILARITY).
SUBCELLULAR LOCATION: Mitochondrial.
SIMILARITY: BELONGS TO THE IF-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PUNCTION: IF 2, ONE OF THE ESSENTIAL COMPONENTS FOR THE INITIATION PUNCTION: IS SYNTHESIS. PROTECTS FORMYLMETHIONYL-TRNA FROM FOR PROTECT SYNTHESIS. PROTECTS FORMYLMETHIONYL-TRNA FROM SPONTANEOUS HYDROLYSIS AND PROMOTES ITS BINDING TO THE 30S SPONTANEOUS HYDROLYSIS AND PROMOTES IN THE HYDROLYSIS OF GTP RIBOSOMAL SUBUNITS. IT IS ALSO INVOLVED IN THE HYDROLYSIS OF GTP RIBOSOMAL SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     148 EAAAYSAPSPK 158

-i- FUNCTION: Promotes orthogonal branching of actin filaments and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        links actin filaments to membrane glycoproteins. Anchors various transmembrane proteins to the actin cytoskeleton and serves as a scaffold for a wide range of cytoplasmic signaling proteins. SUBGUNIT: Homodimer. Interacts with cvHsp. Interacts with various other binding partners in addition to filamentous actin. SUBGELLULAR LOCATION: PERIPHERAL CYTOPLASM.
                                                                                                                                                                                                                                                                                             PIM: The Nefects in FLMA are the cause of periventricular DISEASE. Defects in FLMA are the cause of periventricular DISEASE. Defects in FLMA are the cause of periventricular (PH) also called nodular heterotopia (PH) also called nodular heterotopia (PH) also called nodular heterotopia (PH). PH is an X-linked developmental periventricular (NHBP or BENHI). PH is an X-linked developmental dominant disorder in which many neurons fail to migrate into the disorder in which many neurons fail to migrate into the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. They remain as nodules lining the ventricular programments of the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. They remain as nodules lining the ventricular cerebral cortex. 11 FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.

11 MISCELLANEOUS: THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5.

12 HOMOLOGY CLASSES. SEQUENCE DIVERGENCE BETWEEN THE CLASSES IS DUE TO SINGLE BASE SUBSTITUTIONS AND TO DUPLICATIONS OR DELETIONS WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF THE GENE FOR ALPHA/BETA-GLIADIN PER HAPLOID GENOME.
                                                                                                                                                                                                                                                                                                                                                                              "Evolution and heterogeneity of the alpha-/beta-type and gamma-type gliadin DNA sequences.";
